                           The sequence encodes the mouse antibody 21.6 heavy chain variable region, Ha, directed against leukocyte adhesion molecule VLA-4. Cloned CDNA sequences of mouse 21.6 VL and VH (AAQ99889 and AAQ99892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ9985-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids LA5, LBS and LG9 in the human kappa LC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig L chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 DPKFQGRVTITADISASTAYMELSSLRSEDIAVYYCAREGYYGNYGVYAMDYWGQGTLVT 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21.6 Ig L chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and for treating inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for action of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

chain variable region against leukkocyte adhesion molecule VLA.4.

Cloned cDNA sequences of mouse 21.6 VH (AAQ99892) and VL (AAQ9889)

regions are linked to human constant regions in the construction
of a humanized antibody against VLA.4. The 5' and 3' ends of the
mouse cDNAs are modified using PCR primers (AAQ99895-98) and then
subcloned into mammalian cell expression vectors containing human
kappa or gamma-1 constant regions. In the humanized heavy chain,
amino acids H27, H28, H29, H30, H44 nd H71 in the human HC VR framework are replaced by the amino acid present in the equivalent
position of the mouse 21.6 Ig H chain. Plasmids encoding the
chimeric antibodies are transfected into COS cells. The humanized
antibodies can be used to inhibit adhesion of a leukocyte to an
endothelial cell and to treat inflammatory diseases such as multiple
sclerosis. They can also be used in the treatment of stroke,
crebral traumas, meningitis or encephalitis. The antibodies can
also be used for detecting VLA-4, for affinity purification or for

It is composed of complementarity determining regions from the VH region (see AMW22410) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human 21/28°CL framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate mouse and human DNA sequences. The numanised 21.6 VH and a humanised 21.6 VL (see AMW22412) can be used to produce a claimed humanised 21.6 utilody that is useful in the manifecture of a medicament for treating asthma, atherosclerosis, carthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischemia, and acute leukocyte mediated lung injury. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /label- CDR3 /note= "21.6 complementarity determining region 3"

It is composed of complementarity determining regions (CDRs) from the VH region (see AAW22410) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human 21/28 CL framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human DNA sequences. The humanised 21.6 VL (see AAW22412) can be used to produce a claimed humanised 21.6 vL (see AAW22412) can be used manufacture of a medicament for treating asthma, a histosoclarosis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Humanized antibody; leukocyte adhesion molecule; VLA-4; therapeutic; antibody engineering.
                                                                                                                                                                                                                                                                                                      AIDS, dementia, diabetes, inflammatory bowel disease, Theumatoid arthritis, transplant rejection, graft versus host disease, theumatoid metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin generating idiotypic antibodes. It is also useful for generating idiotypic antibodies. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The sequence represents the mouse anti-VLA-4 antibody 21.6 heavy chain variable region (without signal sequence). Cloned cDNA CDR sequences of mouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the light chain and attibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ9895-98) and then subcloned into constant regions. In the humanized light chain, amino acids L45, L49, CC mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, CC L58 and L69 in the human kappa LCVR framework are replaced by the antino ccide present in the equivalent position of the mouse 21.6 Ig light chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a smultiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningtis or encephaltis. The antibodies can also be used to used for detecting VLA-4, for affinity purification or for generating
                                                                                                                                  /note= "mouse heavy chain variable complementarity

                                               The sequence represents the mouse antibody 21.6 heavy chain variable region directed against leukocyte adhesion molecule VLA-4. Cloned cDNA sequences of mouse 21.6 VH and VL (see AAQ99889) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5 and 3 ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1
Humanized antibody; leukocyte adhesion molecule; VLA-4; therapeutic;

constant regions. In the humanized heavy chain, amino acids H27, H28, H29, H30, H44 nd H71 in the human HC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig H chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alpha-4 integrin; humanised antibody; monoclonal antibody 21.6; asthma; atherosclerosis; AIDS; dementia; diabetes; tumour; metastasis; inflammatory bowel disease; rheumatoid arthritis;

                                                                                                                                                                                                                                               This polypeptide comprises the heavy chain variable region (VH) of mouse anti-alpha-4 integrin monoclonal antibody 21.6. The complementarity determining regions (CDRs) of the 21.6 VH can be incorporated into a human 21/28'CL framework to produce a claimed humanised 21.6 VH (see AAW22413) and a claimed humanised 21.6 rantibody that is used in the manufacture of a medicament for treating a disease selected from asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, mayocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin for use as a vaccine or an immunogen. It is also useful for for use as a vaccine cranimodies. The humanised antibodies of the invention have a half-life in the human circulation essentially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the heavy chain variable region of the humanised murine anti-human cancer antigen antibody (Ab) NR-LU-13,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hAb, specifically NRX451, or its conjugates can be used for the manufacture of a diagnostic or medicament for cancer diagnosis or treatment. The hAb has reduced immunogenicity and toxicity in humans, but retains the ability to bind the NR-LU-13 antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Η;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the humanised antibody NRX 451 (or an antigenbinding fragment), in which the murine parent antibody is ATCC CRL-12360 (also known as NU-LU-13 which targets a 40 kilodalton glycoprotein expressed by many carcinomas) and which comprises the light chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79034 antibody may be administered to treat cancers and use to detect the presence of the antigen in clinical samples. The antibody is a humanised antibody derived from NR-LU-13 antigen. The antibody but retains the ability to bind the NR-LU-13 antigen. The antibody elither does not possess N-linked glycosylation or its N-linked lummunogenicity or toxicity. The present sequence represents the heavy chain variable region of humanised antibody of the invention, NRX451.
                                                                                                                                                                                                                                                                                                                                                                                                                         Humanised antibody NRX-451, which is derived from ATCC CRL-12360, but which has reduced immunogenicity or toxicity, useful for diagnosing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 DLSFQGRVTITADTSINTAYMELSSLRSDDTAVYYCSREVL---TGTWSLDYWGQGTLVT 117

The present sequence encodes a fusion of the single chain antibody bunk-LU-10 and streptavidin. The antibody binds the antigen EGP40 or EPCAM. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a first nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a first nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    presence or absence of, or treating, a target site within a mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 DPKFQGRVTITADTSASTAYMELSSLRSEDTAVYYCAREGYYGNYGVYAMDYWGQGTLVT 120

The present sequence is a fragment of the chimaeric human/murine monoclonal antibody (MAb) ONS-M21. The MAb was prepd. by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAb, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy chain DNA mols. A recombinant vector for the expression of the heavy and light chain DNA mols. was prepd., and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain outlands. Sepd. and connected with a peptide linker to produce a single stranded Fv region. The reshaped Fv region has low human antigenicity, and is therefore expected to be useful as an agent for the diagnosis and treatment of cerebral tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 DPKFQGRVTITADTSASTAYMELSSLRSEDTAVYYCAREGYYGNYGVYAMDYWGQGTLVT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                       AAQ94548 is the plasmid pSCFVT7-hM21, which encodes AAR76682 the human antibody ONS-M21 Fv fragment. The plasmid was used in the construction of an expression vector, contg. cDNA encoding a human/murine chimmeric antibody, reactive with human medulloblastoma (a brain tumour) cells. The chimeric antibody can be used in the diagnosis and treatment of this disease.

The present sequence is a scFv fragment from the chimaeric human/murine monoclonal antibody (MAb) ONS-M21. The MAb was prepd by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAb, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy chain DNA mols. A recombinant vector of for the expression of the heavy and light chain DNA mols. was prepd., and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain DNA mols. sepd. and connected with a peptide linker to produce a single stranded Fv region. The reshaped Fv region has low human antigenicity, and is therefore expected to be useful as an agent of the diagnosis and treatment of cerebral tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Reshaped anti-human myeloblastoma cell human antibody - has low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human antigenicity, and is therefore useful for diagnosis and
treatment of cerebral tumours, e.g. myeloblastoma
                                                                                                                                                                                                                                                                                                 Murine; human; myeloblastoma; chimaera; monoclonal antibody; chimera; single stranded Fv region; low human antigenicity; diagnosis; treatment; cerebral tumour; reshaped.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence encodes the mouse antibody 21.6 heavy chain variable region, HC, directed against leukocyte adhesion molecule VLA-4. Cloned CDNA sequences of mouse 21.6 VL and VH (AAQ99899 and AAQ99892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig L chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and

Tracan also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-idiotype antibodies.

Patent No. 5840299
GENERAL INFORMATION:
APPLICANT: Bendig, Mary M.
APPLICANT: Leger, Olivier J.
APPLICANT: Andanha, Jose
APPLICANT: Jones, S. Tarran
TITLE OF INVENTION: Humanized Antibodies Against Leukocyte
TITLE OF INVENTION: Adhesion Molecule VLA-4
NUMBER OF SEQUENCES: 45
APPLICANT: SATO, KOH
APPLICANT: TSUCHIYA, MASAYUKI
TITLE OF INVENTION: RESHAPED HUMAN ANTIBODY TO HUMAN
TITLE OF INVENTION: MEDULLOBLASTOMA CELLS
NUMBER OF SEQUENCES: 132

RESULT 2
S03471
19 heavy chain V-D-J region (hybridoma G5 Bb 2.2) - mouse (fragment)
C.Species: Mus musculus (house mouse)
C.Sap-1990 #sequence\_revision 07-Sep-1990 #text\_change 20-Jun-2000
C.Accession: S03471; S07453
R.Roca-Serra, J.; Matthes, H.W.; Kaartinen, M.; Milstein, C.; Theze, J.; Fougereau, EMBO J. 2, 867-872, 1983
A;Title: Analysis of antibody diversity: V-D-J mRNA nucleotide sequence of four antihypervariable regions.
A;Reference number: S03471; MUID:84057768; PMID:6416834

A Molecule type: mRNA Sesion: \$03471
A Molecule type: mRNA Sesidues; 7-120 CROCI>
A CROSS-references: EMBL:X01820; NID:951833; PIDN:CAA25962.1; PID:91333983
A) Note: this sequence was determined from the differentiated gene R:Rocca-Serra, J; Mazie, JC; Moinier, D; Leclercq, L.; Somme, G.; Theze, J.; Foug J. Immunol. 129, 2554-2558, 1982
A) Immunol. 129, 2554-2558, 1982
A) Title: The limited diversity of the mouse gamma-chains anti-GAT repertoire does not

```
